

01. SPECIMEN PROFILE

SCIENTIFIC VERDICT

Tomato / Late blight

CONFIDENCE

89.0%

SEVERITY

Severe

CLINICAL OBSERVATIONS

Aggressive oomycete infection (*Phytophthora infestans*). Rapidly evolving necrotic lesions with white fungal growth on leaf undersides in high humidity.

02. PATHOGENESIS FACTORS

Primary Causes	Prolonged leaf wetness, Cool damp nights, Infected transplants
Environmental Temp	10-20°C
Atmospheric Humidity	90%+
Spread Risk	HIGH SPREADING RISK

03. TREATMENT PROTOCOL

ORGANIC RECOMMENDATION

Fixed copper organic sprays

CHEMICAL PROTOCOL

Chlorothalonil (Every 5-7 days)

04. RECOVERY STEPS

1. Immediate isolation of specimen.
2. Full removal of symptomatic tissue.
3. Copper-based fungicide application.
